FIB patterning of single-crystal Quantum Materials
5

What are Quantum Materials?

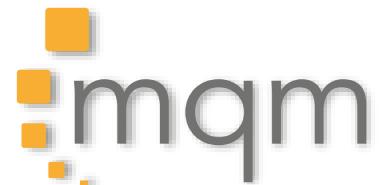

- states of matter [quantum many-body systems] with **emergent macroscopic properties that are intrinsically quantum mechanical.**
e.g. Superconductivity: macroscopic quantum mechanical wave function
- concepts of topological order
e.g. fractional quantum Hall effect and topological insulators, Dirac- and Weyl-Semimetals.
- bad metals, "quantum critical metals", and the "strange metal" in the Cuprates
- New states of Matter, such as Nematicity or Supersolids
- Quantum magnetism, frustrated systems, Spin liquids, metamagnetism

*"The notion of **quantum matter** is useful as a **unifying concept** for describing many of the common themes of interest in two culturally distinct research communities: those studying ultracold atomic gases and correlated electron materials."* [Prof. Ross L. McKenzie]

FIB patterning of single-crystal Quantum Materials

Main research philosophy of our group:

„Explore novel electronic materials on the microscale“

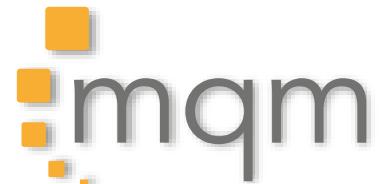

Start from **bulk** material or
powder / **polycrystals**

… and turn it into a **microstructured devices**

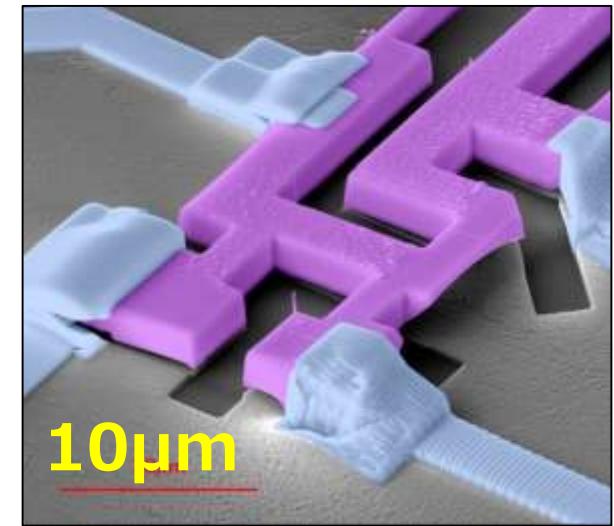

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
8

Main research philosophy of our group: „Explore novel electronic materials on the microscale“

- Discover new physics of quantum matter
„function follows form“
- Mesoscale effects / finite size
- Prototype devices of
quantum matter electronics

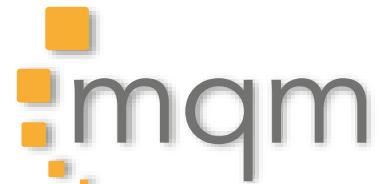

… and turn it into a **microstructure**

Why single crystals? → Quality/Purity

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
9

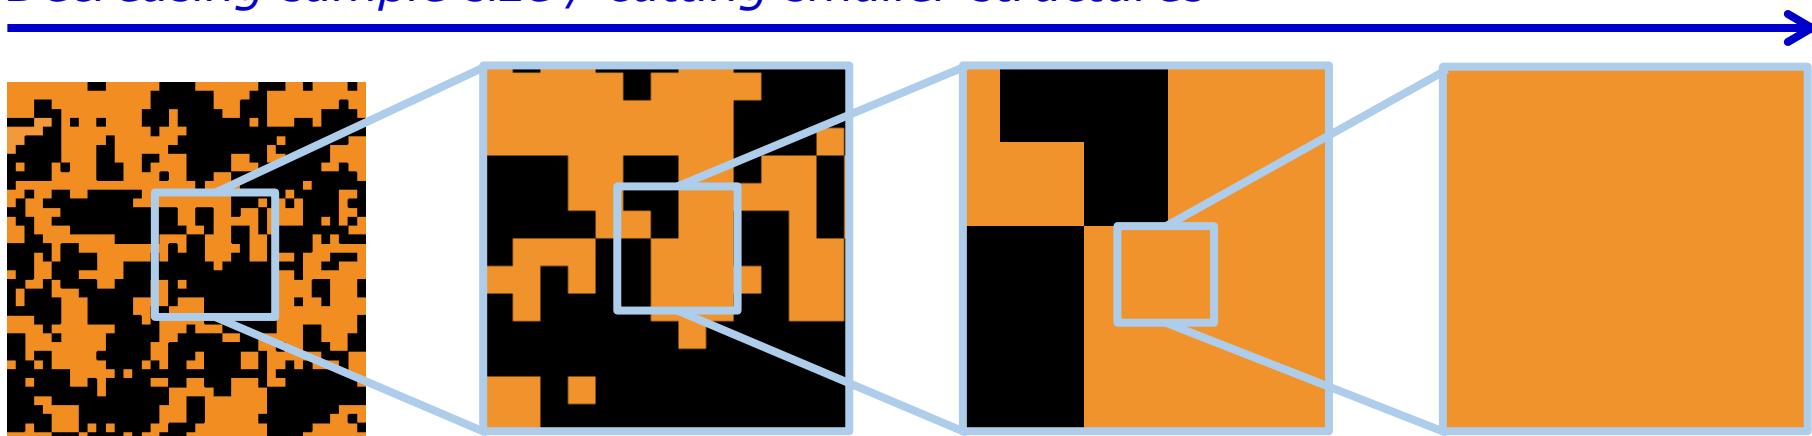

Why microstructures? – quantum effects at small scales

Qualitative change in quantum behavior when system size crosses **relevant length scale L**

L: Correlation length

- Magnetic
- Structural (CDW in high T_c)

Decreasing sample size / cutting smaller structures

Macroscopic ($>L$)

- Averaged resistivity
- resistivity isotropic

Mesoscopic ($\sim L$)

- Domain boundary scattering
- Domain dynamics

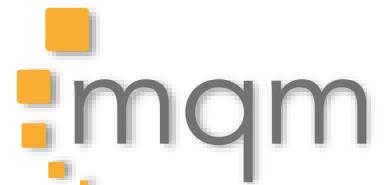

Microscopic ($<L$)

- Intrinsic scattering
- resistivity anisotropy

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
10

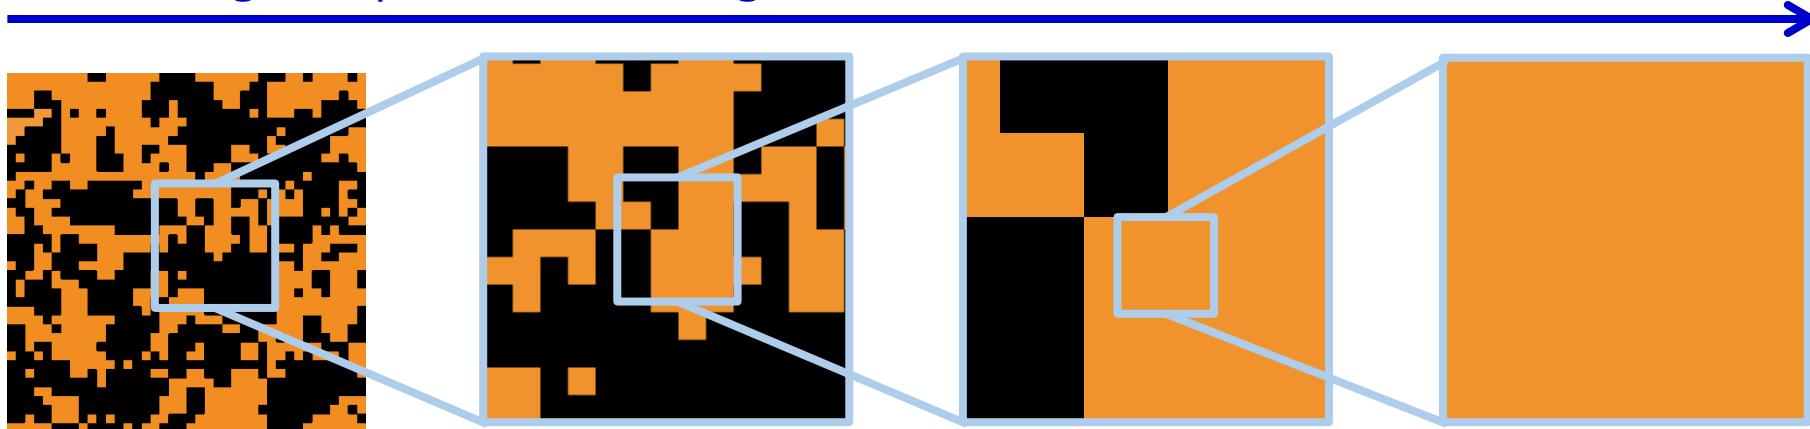

Why microstructures? – quantum effects at small scales

Qualitative change in quantum behavior when system size crosses **relevant length scale L**

L: Correlation length

- Magnetic
- Structural (CDW in high T_c)

Decreasing sample size / cutting smaller structures

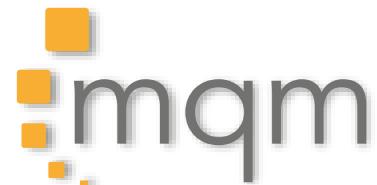

Mesoscopic ($\sim L$)

- No rigid definition:
- range between **a few nanometers** and **a few micrometers**

FIB patterning of single-crystal Quantum Materials
13

Focused Ion Beam (FIB) Microfabrication

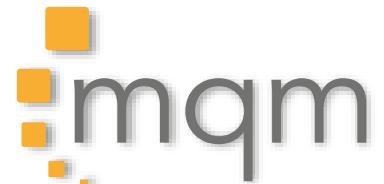

Focused Ion Beam etching (FIB)

- Industrial application:
 - investigation of defects in computer chips and materials
- Material science:
 - Transmission Electron Microscopy (TEM) Lamella preparation
- Biology:
 - Slicing organic specimens like cells and tissue

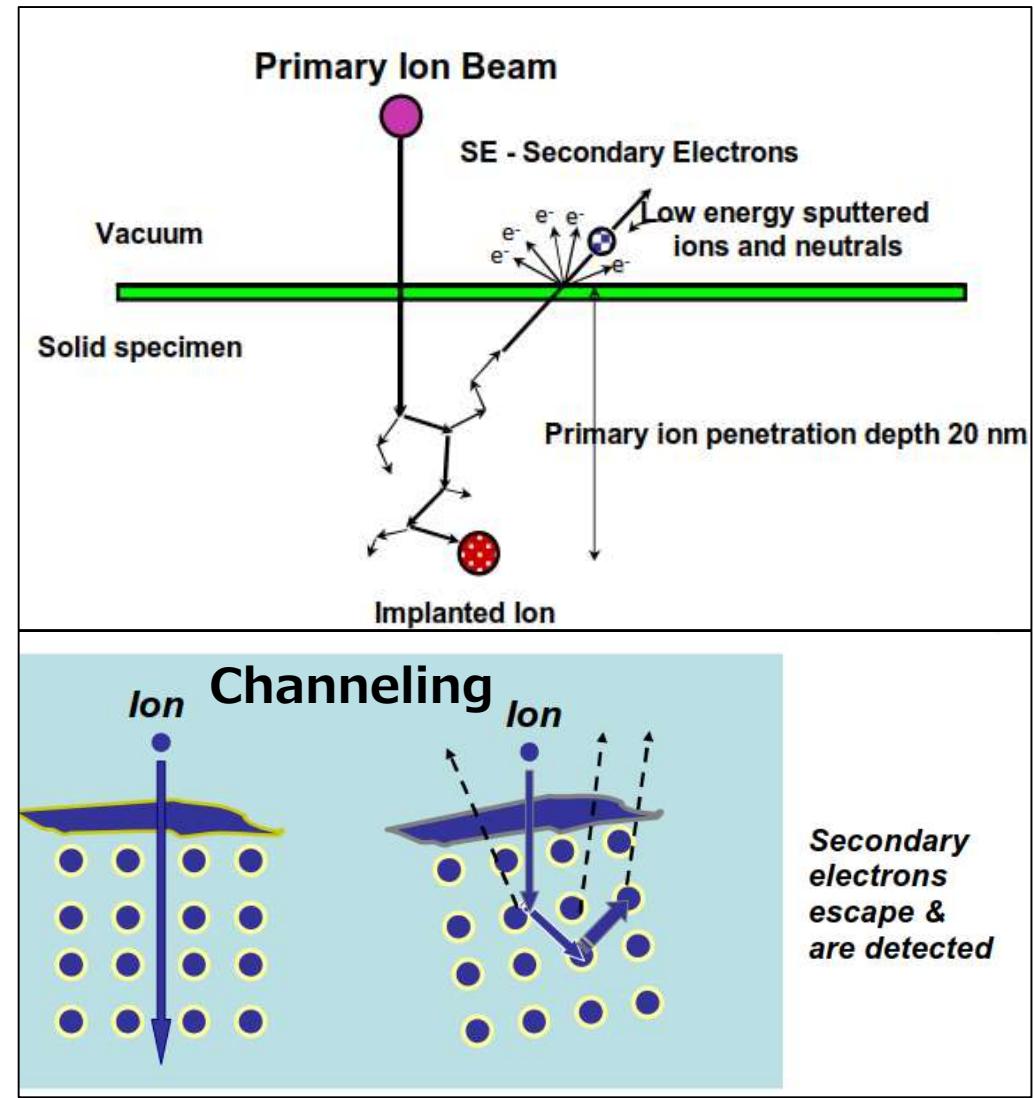

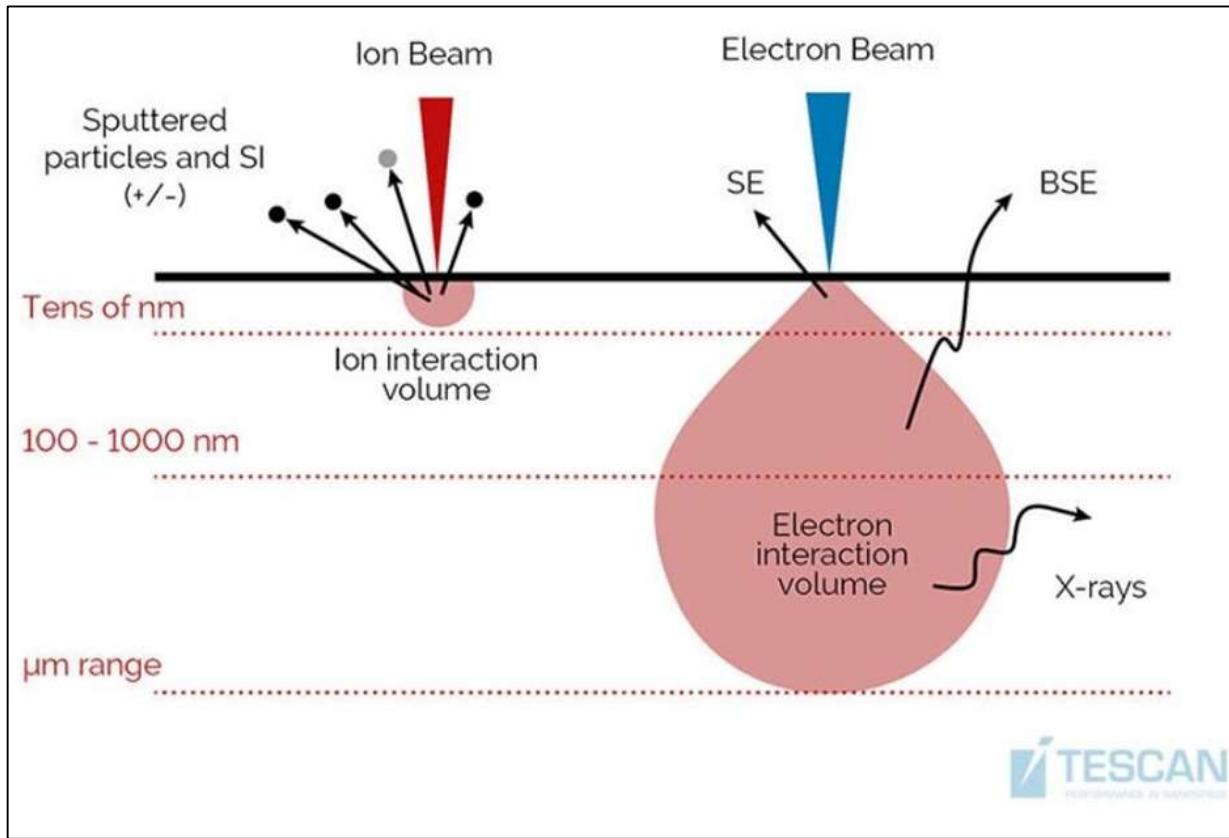

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
14

Focused Ion Beam (FIB)

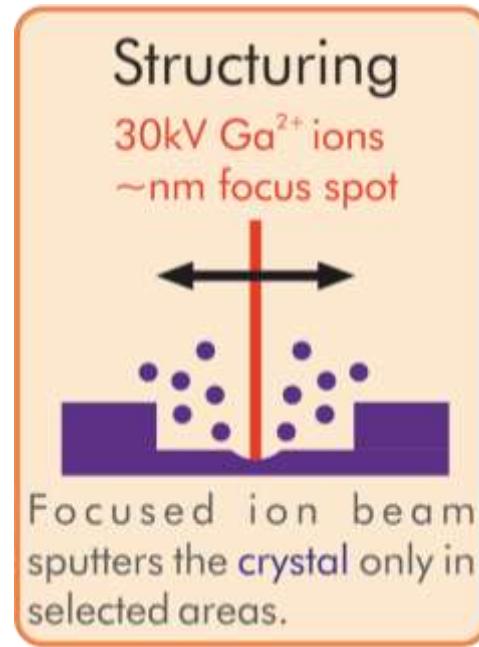

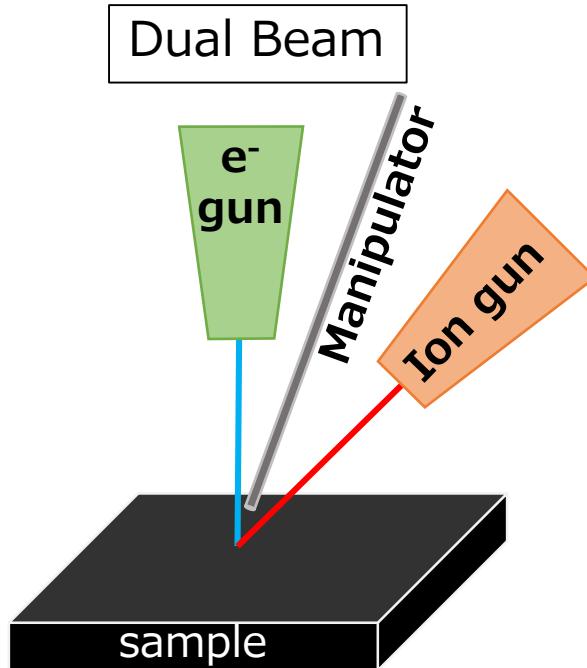

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials

15

Focused Ion Beam (FIB)

- As-grown crystallites
- Feature size down to $\sim 100\text{nm}$
- 3D Structuring

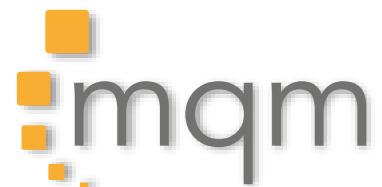

Difference of FIB to SEM:

- Removes/Adds Material
- Secondary Ion imaging shows material contrast
- Channeling contrast
- In-situ sample preparation
- Combines high magnification imaging and sample modification
- Ion beam has smaller interaction volume at the target comparing with E-beam ($\sim 5\text{-}40\text{nm}$ for energies in the 30 keV range)

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
16

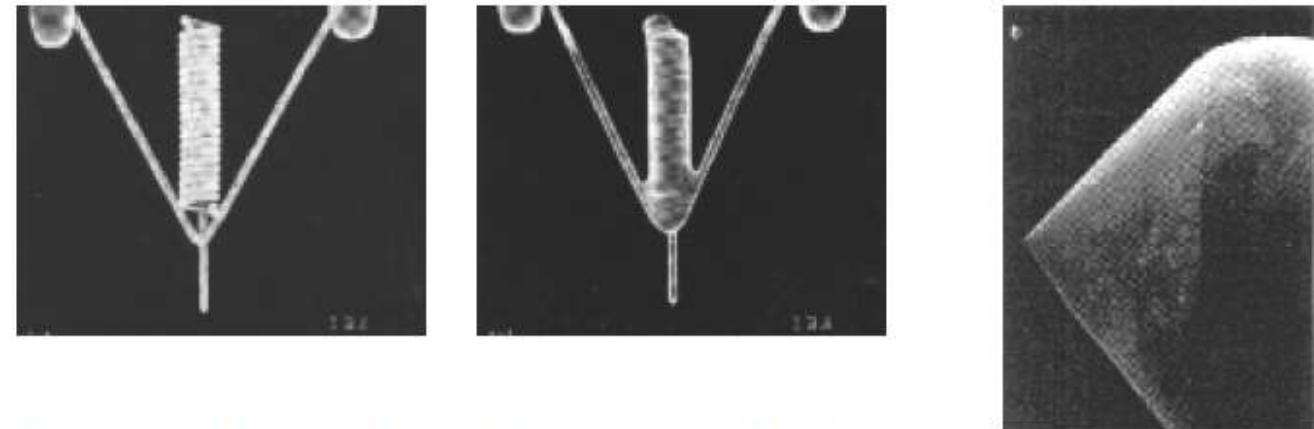

Focused Ion Beam (FIB)

most commonly used ion: **Gallium**

- longest liquid range of any metal (from 29.8°C to 2175°C)
- providing room temperature operation
- long lifetime source
- Spot size reaches below $\emptyset \approx 10$ nm
- highly vacuum compatible
- large ions for physical sputtering
- Below the melting point Ga is a soft, silver white metal, stable in both air and water.

Liquid Metal Ion Source (LMIS)

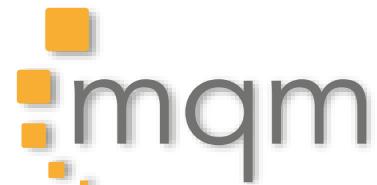

The tungsten is wetted with gallium which is held in the spiral by surface tension. The vapour pressure is about 10^{-7} mbar.

Frozen-in -shape LMIS showing 49° half angle. The field emission area is a 2-5nm across giving current densities $>10^8$ Acm $^{-2}$.

FIB patterning of single-crystal Quantum Materials
19

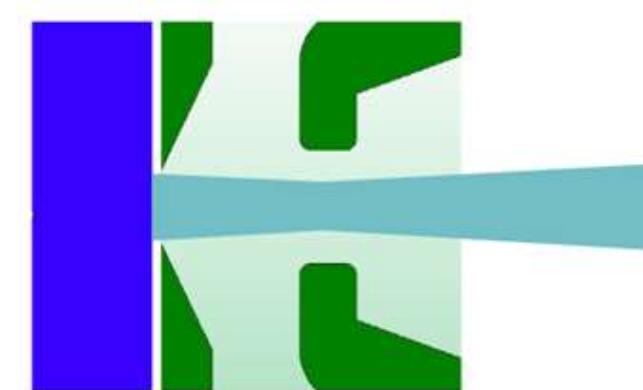

Focused Ion Beam (FIB)

Alternative Ion Source

Liquid Metal Ion Source (Gallium)

*Point source (50nm diameter)
Low angular intensity (15uA/sr)*

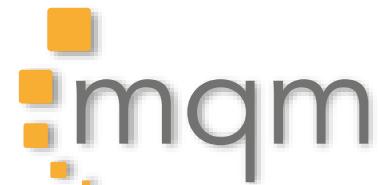

Plasma Ion Source

*Broad Area Source (10-100um diameter)
High Angular Intensity (5-10mA/sr)*

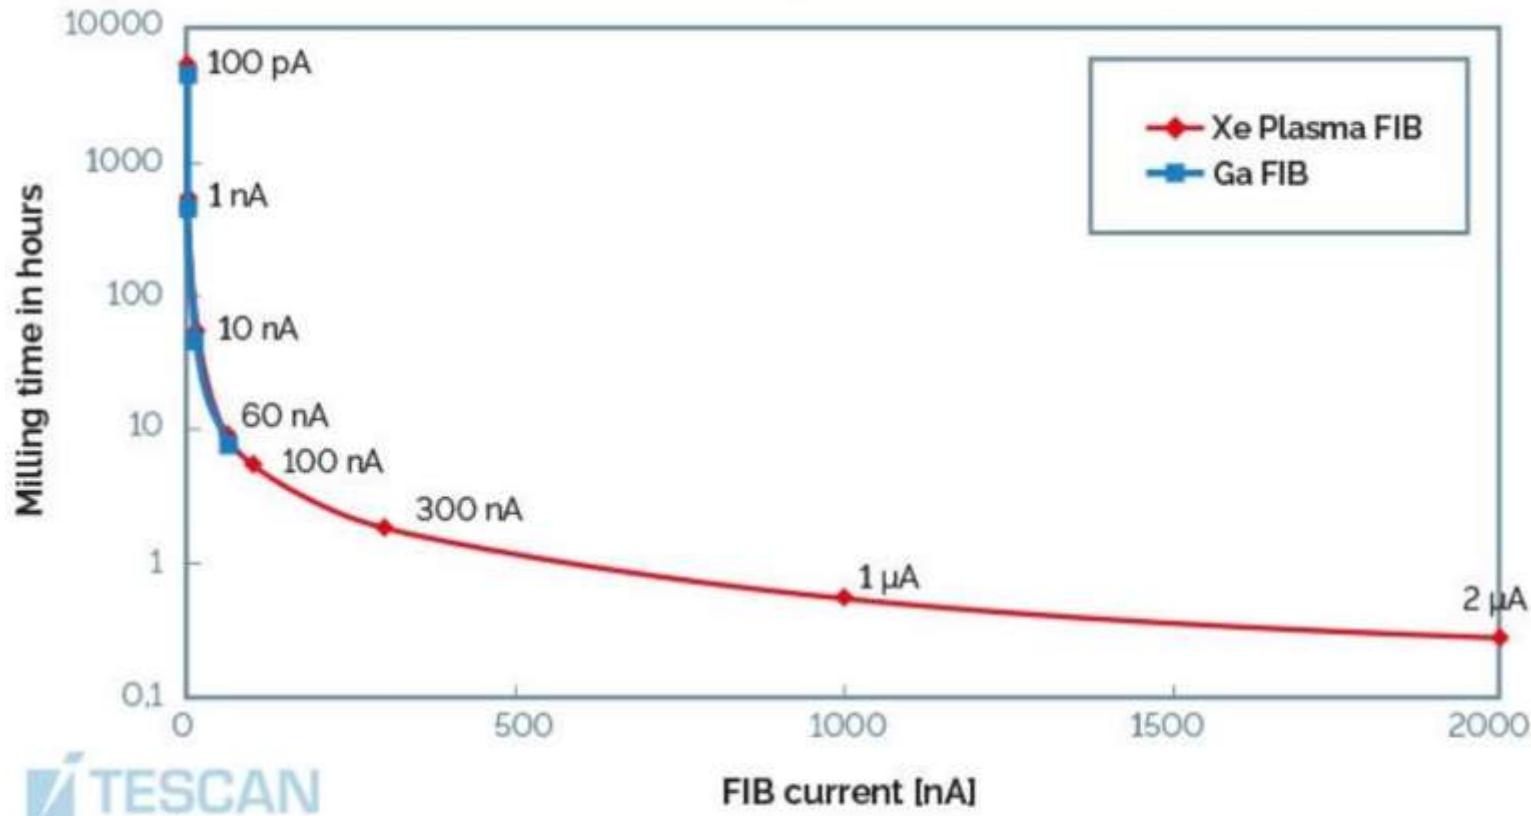

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
20

Focused Ion Beam (FIB)

Volume milling time vs. ion milling current

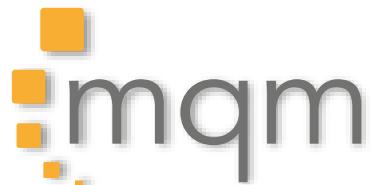

Milling time as a function of the FIB current on a Si sample with a volume of
 $100 \times 100 \times 100 \mu\text{m}^3$

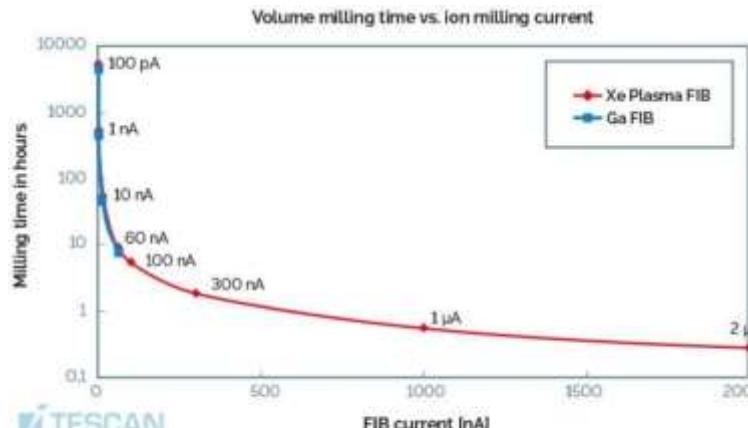

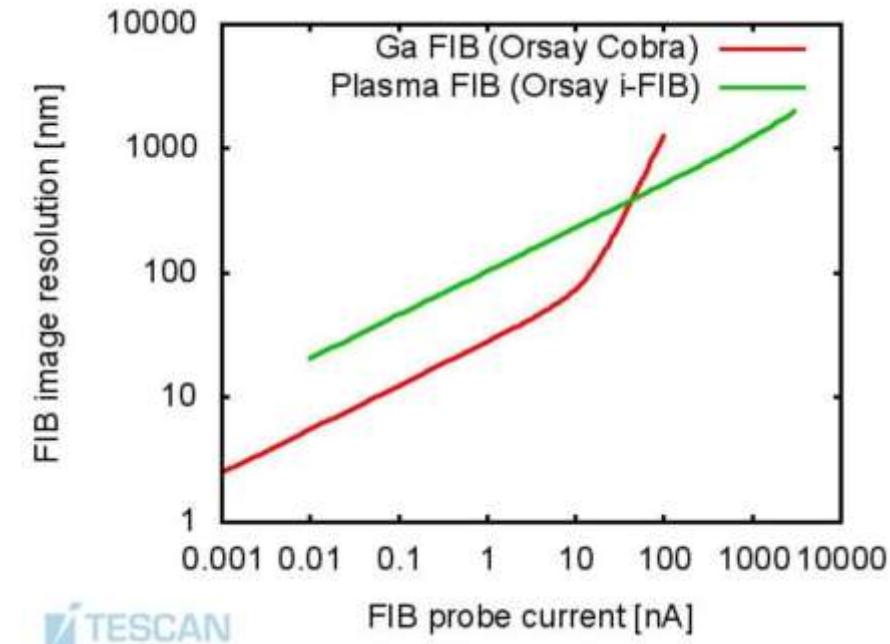

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
21

Focused Ion Beam (FIB) – Sputtering Rate

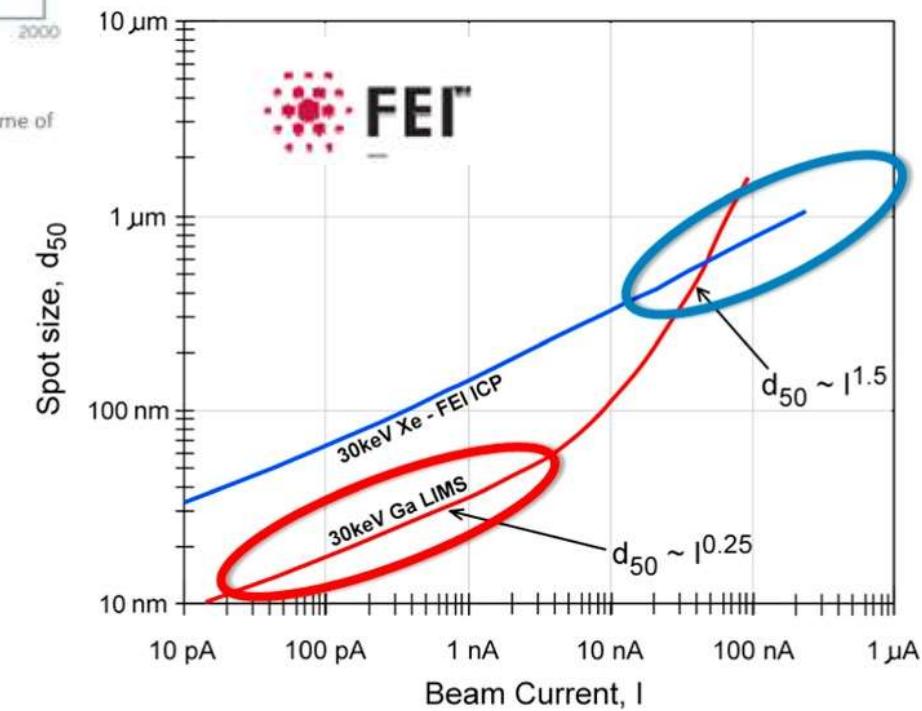

Milling time as a function of the FIB current on a Si sample with a volume of
100 × 100 × 100 μm³

Sputtering Rate

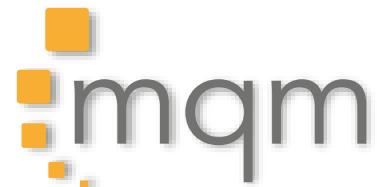

$$R = \frac{d}{I t}$$

$$R = \frac{1}{N_T q} Y_S (E, \Theta)$$

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
22

Focused Ion Beam (FIB) – Sputter Yield

P. Sigmund, Phys. Rev. 184, 383 (1969)

$$Y(E) = \frac{3}{4 \pi^2 c_0} \frac{1}{U_0} \alpha \left(\frac{M_2}{M_1} \right) S_n(E) \frac{1}{\cos^n(\Theta)}$$

Mass-dependent fit parameter

Screening constant

$$c_0 = \frac{1}{2} \pi \lambda_0 a^2$$

Surface binding energy

Nuclear stopping cross section

$$S_n(E) = \frac{1}{\epsilon_0} \frac{a Z_1 Z_2 e M_1}{M_1 + M_2} s_n(\epsilon)$$

$$a = 0.8853 a_0 (Z_1^{2/3} + Z_2^{2/3})^{-1/2}$$

Numerical function
estimated from experimental data

$$\alpha(M_2/M_1) = 0.1694 + 0.04218(M_2/M_1) + 0.0518(M_2/M_1)^2 - 0.00926(M_2/M_1)^3 + 0.00049(M_2/M_1)^4$$

$E \propto V$
Reducing V
reduces ion penetration-depth
AND sputtering rate

$$a_0 = 0.529 \text{ \AA} \text{ (Bohr radius)}$$

$$s_n(\epsilon) = \frac{3.441 \sqrt{\epsilon} \ln(\epsilon + 2.718)}{1 + 6.355 \sqrt{\epsilon} + \epsilon(6.882 \sqrt{\epsilon} - 1.708)}$$

$$\epsilon = 4\pi\epsilon_0 \frac{M_2}{M_1 + M_2} \frac{aE}{Z_1 Z_2 e}$$

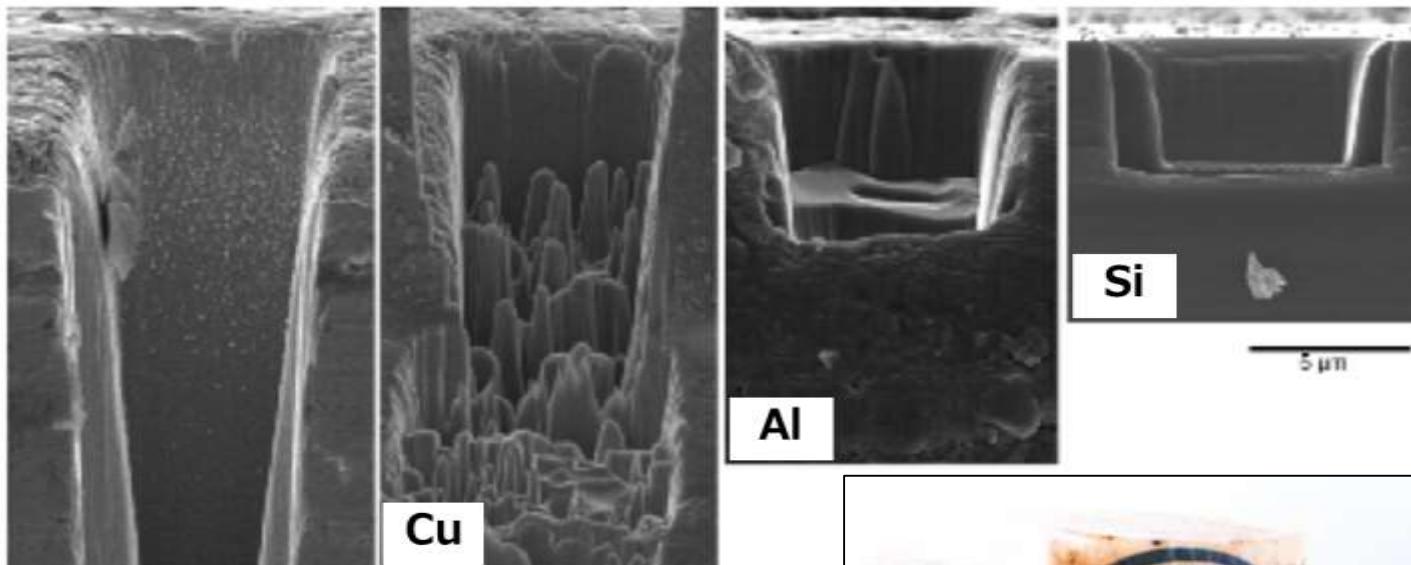

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
23

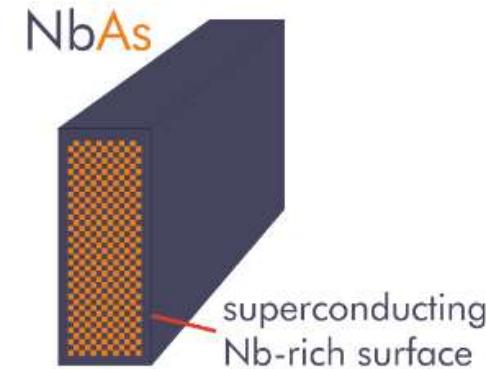

Focused Ion Beam (FIB) – Sputter Yield

Different materials have different sputter yields

„Maja effect“

Ion-irradiation of a **NbAs/TaAs**
→ interface between the topological metal and the superconductor is formed within the material itself.

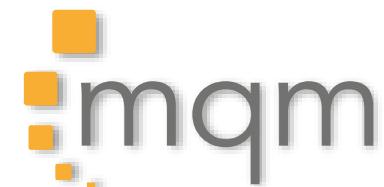

[Bachmann et al., Sci. Adv. Vol. 3, no. 5 (2017)]

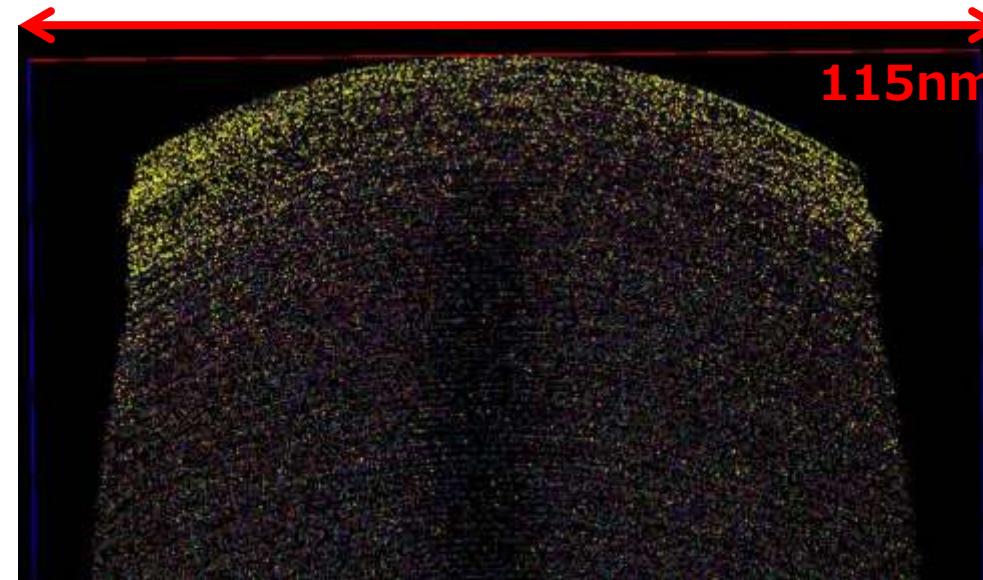

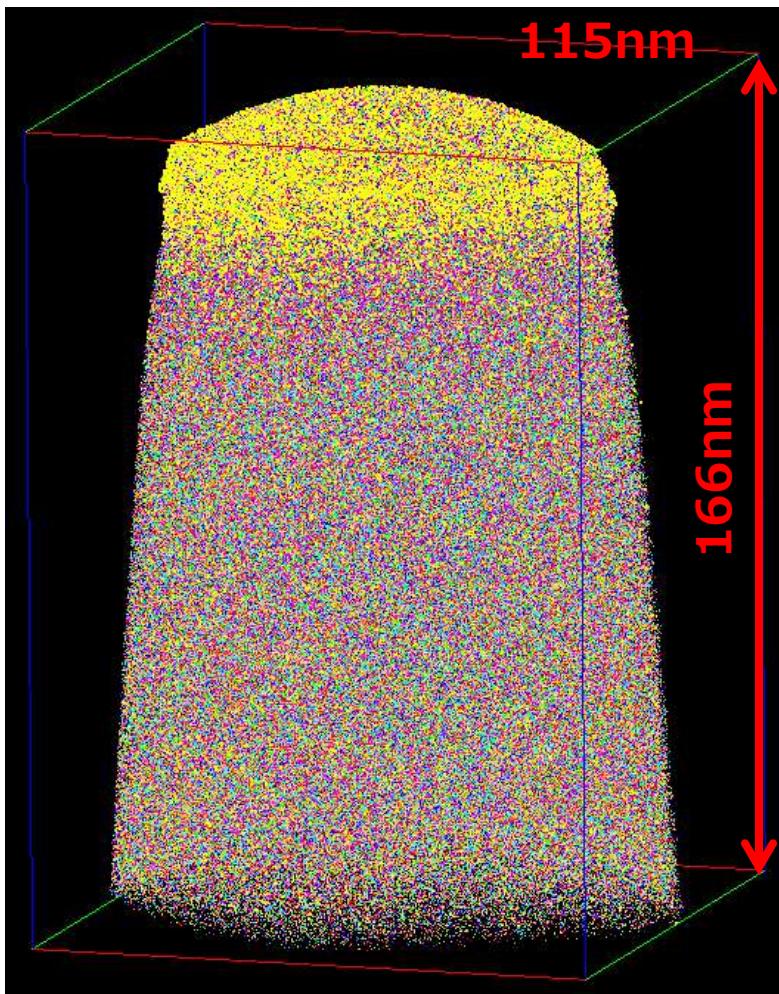

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
24

Focused Ion Beam (FIB) – Ion Implantation

Real space atom imaging of Ga-FIB cut (30 keV) SmFeAs(O,F)

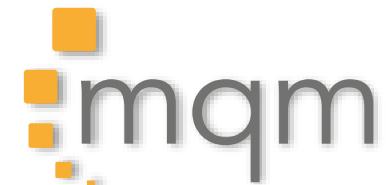

- Ga concentration decreases from 2% at the surface to 0% within 25nm (yellow)
- Crystal planes & lattice visible below 16 nm

No evidence of material damage below 30 nm

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
25

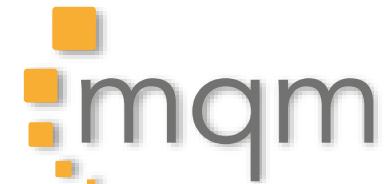

Focused Ion Beam (FIB)- Advantages / Disadvantages

- Ga^{2+} Ion implantation
- Variance in the local angle of incidence effects
 - impact of Ions
- Channeling (poly-crystals, impurities, defects)
- Ion-induced grain growth (recrystallization)
- Redeposition
- Local heating effects

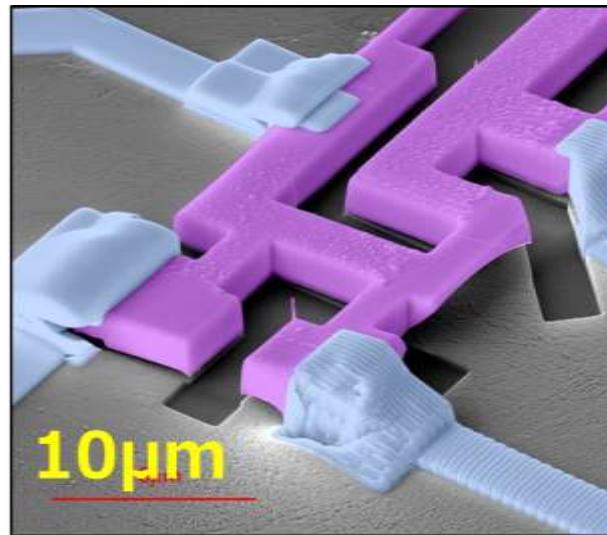

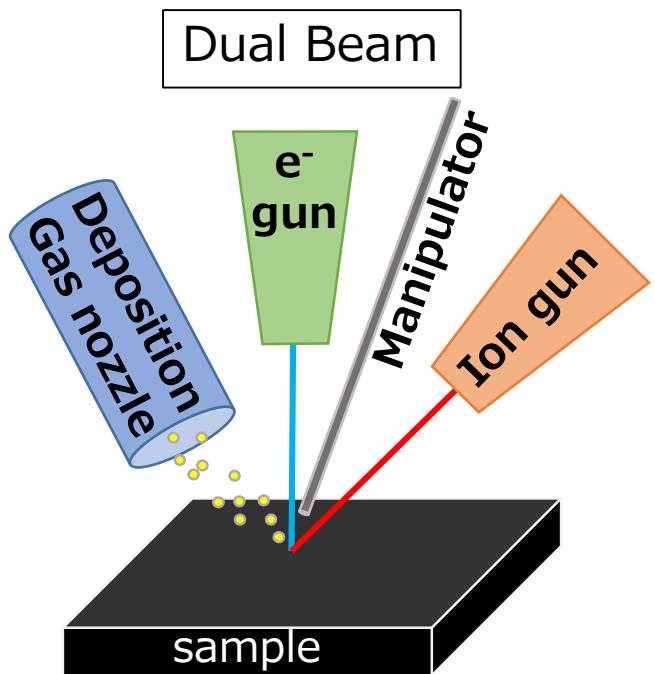

MPI
CPfS

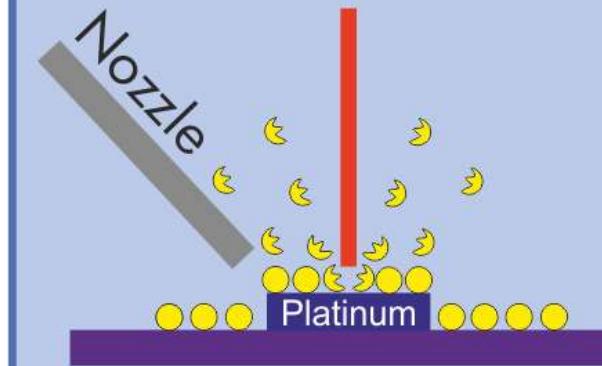

Toni Helm
FIB patterning of single-crystal Quantum Materials
26

FIB-assisted deposition

Contacting
Precursor gas adsorbs
on the surface

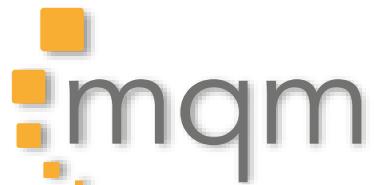

Ions crack metall-organic
molecules. Platinum is
deposited on the surface.

MPI
CPfS

Toni Helm
FIB patterning of single-crystal Quantum Materials
27

FIB-assisted deposition

- delicate balance between decomposing the adsorbed gas and sputtering.
- Pt, W, C or insulators

Example Platinum: $C_9H_{16}Pt$, trimethyl(methylcyclopentadienyl)platinum

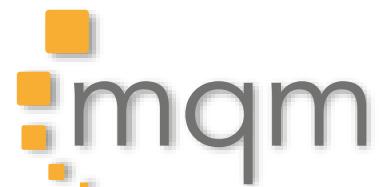

- Solid at room temperature (Operating Temperature 38-42 °C)
 - Very hard, and therefore stable against thermal cycling
 - Chemically resistant
-
- For metal deposition, the effect of Ga^+ implantation is not so critical:
deposited Pt consists of **~46% Pt, ~24% C, ~28% Ga, ~2% O**

[J. Vac. Sci. Technol. B **19**, 6 (2001)]
